Title: "Conveying Device for Conveying Workpieces"

Abstract: (no Fig.)

The invention refers to a conveying device for conveying workpieces, for example in a production line, the conveying device comprising at least one driving line divided into several sections, and each section being able to convey workpieces independently from other sections.

The invention is characterised by the fact that at least one central drive is provided which drives the section for a conveying of the workpieces via a coupling.
